Claims Link Climate Change to Social Issues in the US, Sparks Debate

By Brian Kanke
Chairman of Zoo Pharma Dynamics

The controversial issue of climate change is being held accountable for all the problems in the United States of America. It is being blamed for racism, crime, and personal failures. However, the main flaw in this theory is that most people do not believe it, although there are enough who do. If you examine the interesting facts I have provided, you will see that these facts have been consistent since the earliest recorded weather records and still hold true today. I would argue that yes, the climate does change because that is its normal behavior. If there were anything more to it, the interesting facts I have presented would be disrupted.

I find it unethical to spread false science for the purpose of supporting a political agenda. Yes, I am saying that the current usage of climate change is being manipulated as a political tool to create distractions and promote the radical left. If all other attempts to radicalize the public have failed, or as we commonly say, have been proven false, then target the weather. The weather is an easy subject. Weather forecasts are often incorrect, but it is widely accepted that we frequently make mistakes and in most cases, it becomes a joke when a forecast is completely wrong. Therefore, society has accepted that weather prediction is often unreliable with no one to blame. The radical left recognizes this lack of trust, and they take advantage of it by blaming everything on climate change. Do they get away with it because it aligns with our acceptance of our failure to accurately predict the weather?

The historical patterns of weather remain unchanged today. We experience periods of heat, cold, rain, severe weather, and catastrophic storms throughout history. I believe that Mother Earth, along with Mother Nature, has the ability to take care of itself. Our technological advancements have significantly improved our environment compared to 10 years ago, and these advancements continue to occur. I have lived in South Texas for more than 20 years. It typically stops raining in May and does not rain again until Dove Season begins. It is hot, and that has always been the case. Every 10 years, we experience freezing temperatures, snow, or ice. I do not consider this climate change; instead, I simply say, "Welcome to South Texas!"

Let us all focus on the factual scientific evidence and concentrate on solving more important issues for the benefit of God and Country!

Did You Know

- Earth gets colder than Mars
- One billion tons of water falls every minute
- Lightning strikes 8.6 million times per day
- Severe weather causes billions of dollars in damage
